July 26, 2018

Dear Kevin Mottus,

I have become comfortable with challenge, having survived an abusive childhood, had four ectopic pregnancies in my late 20s, breast cancer, systemic candidiasis and leaky gut in my 30s, and severe malnutrition, three surgeries to repair a large abdominal hernia and four prolapsed organs, and lyme disease in my 40s. I didn't think I would live to be 50, but after restoring my health I decided that I needed to live another 50 years because I just started living. I didn't survive all of that to have EMF hypersensitivity take me out.

The realization that I have EMF hypersensitivity blindsided me these past two months. It took time to wrap my brain around it, and research and figure out what to do about it without being robbed by scams I knew were sure to be out there.

It seems I am at the forefront of this thing because very few people have heard of it and not many people are talking about it, yet. At least not with the seriousness it deserves.

Looking back at the past 10 years, I clearly see how this happened to me without me being aware of it. Since 2008, I have used a laptop on Wi-Fi for many hours every day attending college, doing research, starting my business, writing my books, building websites, producing videos, and serving clients. **My two daughters have been with me everywhere I've been and they were exposed to it too, so they also developed symptoms of EMF hypersensitivity. What really advanced this into the level of sensitivity my children and I have was upgrading our Wi-Fi at home to 5G in October 2017. Since then my children and I have not been well (recurrent infections that took months to recover from, but not fully) and for 9 months I could not figure out why. Previously, my children didn't get sick.** What really got my attention was when I experienced breast pain. Then I realized that part of my body was closest to the laptop and cordless keyboard. Exposure to EMF radiation is cumulative and that's why it took 10 years for the symptoms to appear.

How fortunate for me I live where cell phones don't work, we have no power lines or cell phone towers, and our neighbors are far apart so we are not overlapping Wi-Fi signals, or smart meters. Most other people live with this 24/7 and don't get a break from it to be able to notice the difference. Also, I am fortunate not to have allergies or headaches, so when I developed these symptoms as part of a pattern I took note. I felt it whenever I was in my home, but especially while working in my office and every time I went into town. I felt much better while working in my garden, walking the dogs or training my horse. Due to the change in exposures, I was able to figure this out. I have

become a human frequency meter, literally. I have noticed many people, including my clients, have the symptoms of EMF hypersensitivity and they think it is allergies, colds that won't go away, chronic pain and fatigue, or headaches that medications fail to remedy. I am making them aware of this.

First, I had to correct the problem for myself at home by eliminating Wi-Fi and hardwiring the Internet with an ethernet cord. I built a Faraday cage around the router and my computer. I grounded every thing, installed Stetzer filters, got rid of my cell phone and laptop computer, replaced my DECT cordless office phone system with a low EMF phone, replaced my alarm clocks with battery operated, replaced my wireless keyboard (with Bluetooth) with a refurbished wired keyboard, and installed a computer monitor shield to make it possible for me to continue serving my clients.

I truly cannot go away from home without wearing my EMS shielding garments from head to toe. One day a week, I go shopping and run errands. I can only tolerate 3 to 4 hours of being in the EMF zone, as it is now. My world has become very small all of the

sudden. I cannot go to the lake 4 miles from our home, church, the wedding we were invited to this month or to visit friends. I can't go anywhere now. It would be

devastating for my family if my husband were to develop hypersensitivity to EMFs too. He would be unable to work at the job he has had for over 25 years. This is debilitating with symptoms of fatigue, depression, insomnia, infertility, headache, poor memory, inability to concentrate, heart arrhythmias, gastrointestinal issues, and many others. Driving around the Washington DC beltway in May without EMF protective clothing, I had difficulty mentally focusing on driving safely and was anxious to arrive home before I could have an accident.

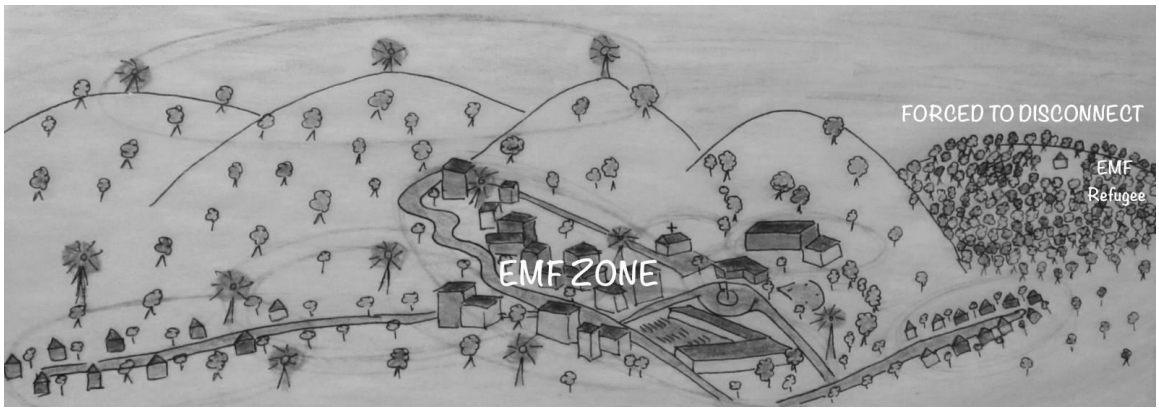

During my last shopping trip many people asked me if I am a beekeeper. One man actually worked for the EPA, and he said they are studying how this is affecting the honeybee population because they can't find their way back to the hive. I have difficulty finding the words to express how traumatic this is for me emotionally. As a business woman, I can't wear jewelry or the clothes in my closet, and I cannot attend conferences or travel for book signings and speaking engagements anymore.

I took a tri-field meter with me to see what exposures I have been experiencing along with everyone else and the numbers are horrifying. In town readings were 11.731 with higher peaks. On the interstate, it was 1.631. In front of a home with Wi-Fi, it was .065 and on the road near my home it was .000 with peaks around .005. I am feeling symptoms with RF readings as low as .014 mW/m.

Many people don't feel it yet, but they will and when they do, it will be misdiagnosed and treated as something else. The body responds to this man-made pathogen in the way it was designed to respond to all pathogens— by producing mucus and inflammation. If 5G is rolled out, it will be devastating. This is humanities Kryptonite and will be an extinction event for us all if it is not stopped.

I am a prisoner in my own home now, but if I lived near a source of this there would be no safe place. I can't go anywhere without wearing special clothes to block this radiation, but they have an upper limit of 30-40 GHz. 5G is 90 GHz. 95 GHz is used by the military as a weapon of war! My abilities are limited now, but if 5G is out there, I will be unable to shop for food for my family, go anywhere. I will not be the only one.

I appreciate the work you are doing to oppose all legislation in favor of 5G, like Senate Bill S3157. Fiberoptic cable is a much better and safer solution.

I wish you optimal health, safe travels and many blessings,

Johnna Wheeler
